

## End-User Security Awareness Adoption

In response to the recent surge in Ransomware and similar attacks, System Source recommends testing and training to increase awareness among employees.

**Goal:** This jump start prepares you to develop and implement a security phishing and training plan for your employees.

**Step 1 –** We’ll develop your end-user awareness security plan in conversation with your stakeholders. This deliverable covers IT security maturity, training, behavior and culture management.

**Step 2 –** We’ll customize training paths and phishing software including AD integration and reporting. We’ll recommend appropriate phishing templates, frequency and training modules.

**Step 3 –** Deploy first simulated phishing and social engineering attacks so employees are conditioned to look for red flags.

**Step 4 –** Deploy learning modules covering topics critical to the organization, including behavior, policy and compliance expectations.

**Step 5 –** Add supportive messaging and interactive activities (Diamond level only) to develop a sustainable security mindset.
